Vani Juneja

vanijuneja7@gmail.com | Jaypee University of Information Technology (JUIT)

PROFESSIONAL SUMMARY

Computer Science and Engineering undergraduate at Jaypee University of Information Technology with a CGPA of 9.14/10. Interested in software engineering, full-stack web development, and applied machine learning. Has worked on a React-based news discovery and recommendation project integrating an external news API and Firebase. Focused on building practical, user-friendly applications and strengthening skills in frontend development, backend APIs, databases, and problem solving.

TECHNICAL SKILLS

Programming Languages: C, C++, Python, JavaScript

Frontend Development: React, HTML5, CSS3, responsive UI development

Backend Development: Node.js, Express.js, REST API concepts

Databases & Cloud Services: Firebase, MongoDB, MySQL

Machine Learning: Recommendation systems, content-based filtering concepts, TF-IDF and cosine similarity *(include the last two only if implemented)*

Developer Tools: Git, GitHub, VS Code

Computer Science Fundamentals: Data Structures, OOP, DBMS, Operating Systems, Computer Networks

PROJECTS

1. Personalized News Recommendation System | React, News API, Firebase, Machine Learning

- Developed a React-based interface for discovering and browsing news articles retrieved from the News API.
- Organized news discovery around categories and search, helping users navigate relevant articles more easily.
- Integrated Firebase for application services such as authentication and/or user preference storage, depending on the implemented features.
- Designed a recommendation workflow intended to personalize article suggestions using user interests and article content.
- Potential ML approach: TF-IDF vectorization and cosine similarity for comparing article content; list these as implemented only if they are part of your actual code.

2. Full-Stack E-Commerce Platform | React, Node.js, Express.js, MongoDB

- Project proposal / planned implementation: a shopping application with product listings, product detail pages, category browsing, and search.
- Planned REST API endpoints for product retrieval, user accounts, cart operations, and order creation.
- Planned MongoDB collections for users, products, carts, and orders, with input validation and authentication.
- Intended to provide a responsive interface and a clear separation between frontend components, backend routes, and data models.

3. Student Attendance Management System | React, Node.js, Express.js, MongoDB (proposed project)

- Proposed web application to help instructors create classes, maintain student records, and review attendance by date or course.
- Planned role-based workflows for students and faculty, including attendance summaries and individual attendance history.
- Planned backend APIs for class management, attendance marking, and report retrieval, with database validation to reduce duplicate records.
- Could be extended with QR-based check-in and downloadable attendance reports after the core application is implemented.

Project status note: The E-Commerce Platform and Student Attendance Management System are proposed project ideas, not claims of completed work. Keep only technologies and features you have genuinely implemented; update these sections as you build them.

EDUCATION

Jaypee University of Information Technology (JUIT), Waknaghat | 2024 – Present

Bachelor of Technology (B.Tech), Computer Science and Engineering

CGPA: 9.14 / 10

Relevant Coursework: Data Structures, Database Management Systems, Web Development, Operating Systems, Computer Networks, Probability and Statistics

AREAS OF INTEREST

Software Engineering • Full-Stack Development • Machine Learning Applications • Web APIs • Data-Driven Applications
